

Open Science Grid

# **Building a Real Workflow**

**Thursday morning, 9:00 am**

Lauren Michael <lmichael@wisc.edu>

Research Computing Facilitator

University of Wisconsin - Madison

# Workflows *Should* Make Life Science Easier

---

- non-computing “workflows” are all around you ... especially in science
  - grading exams
  - instrument setup
  - experimental procedures
- when planned/documented, workflows help with:
  - organizing and managing processes
  - saving time with **automation**
  - objectivity, reliability, and reproducibility  
(THE TENENTS OF GOOD SCIENCE!)

# Workflows are like Computing Algorithms

- Steps
- Connections
- (Metadata)

# 'Engineering' a Good Workflow

---

1. Draw out the *general* workflow
2. Define details (test 'pieces' with HTCondor jobs)
  - divide or consolidate 'pieces'
  - off-load file transfers and consider file transfer times
  - identify steps to be automated or checked
3. Build it piece-by-piece; test and optimize
4. Scale-up: data and computing resources
5. What more can you automate or error-check?

(And remember to document)

# From schematics...

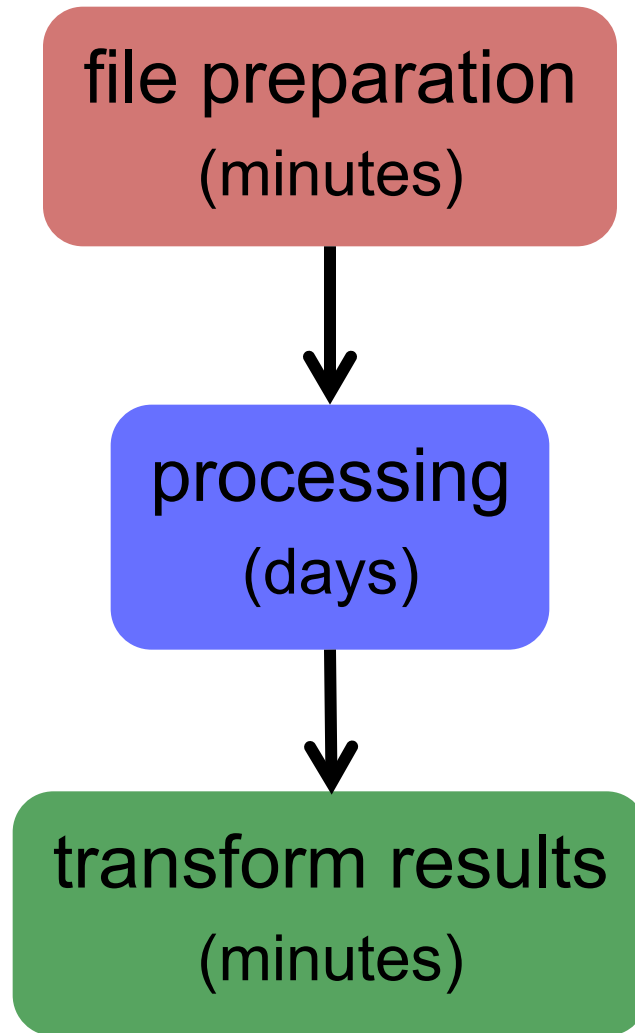

# ... to the real world

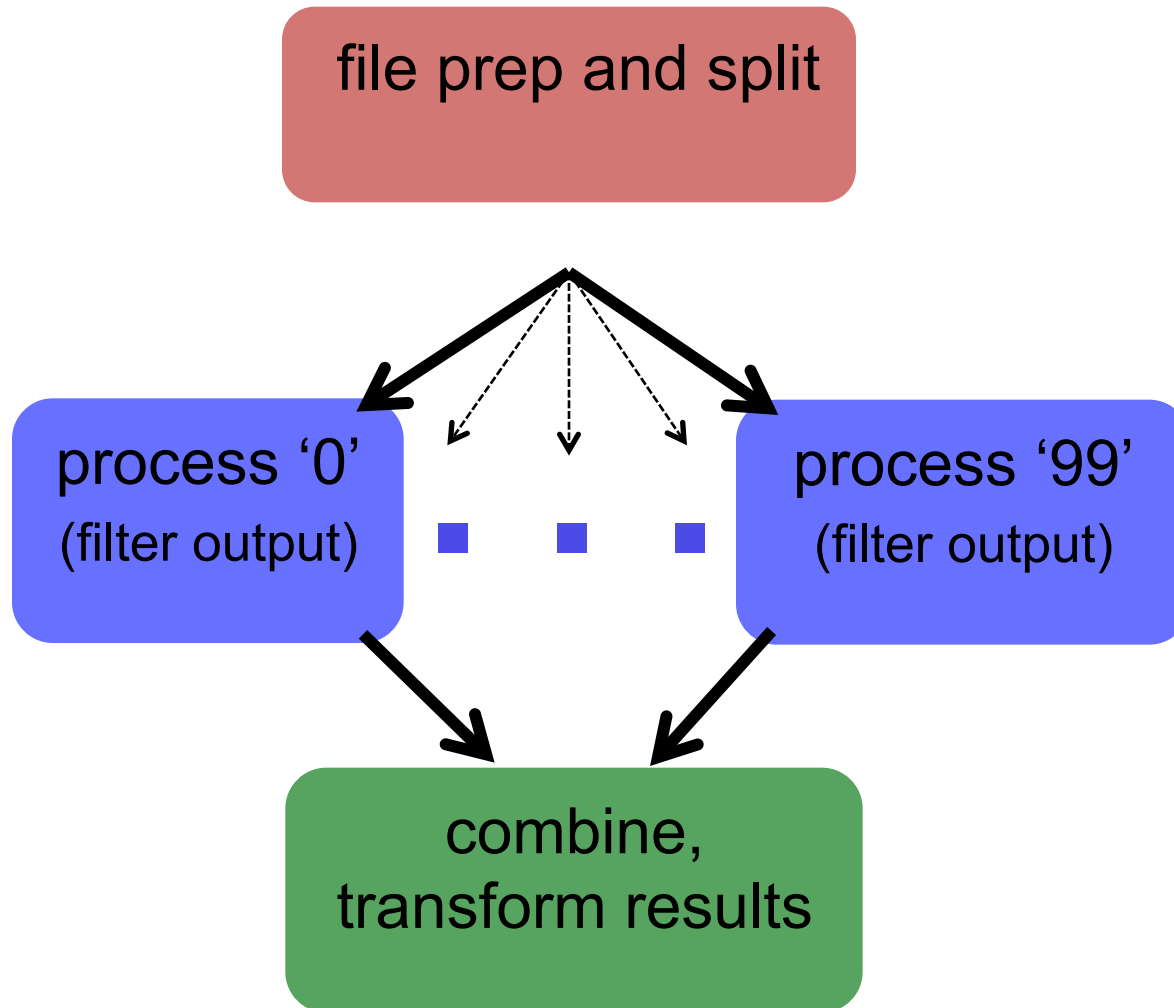

# Start with This

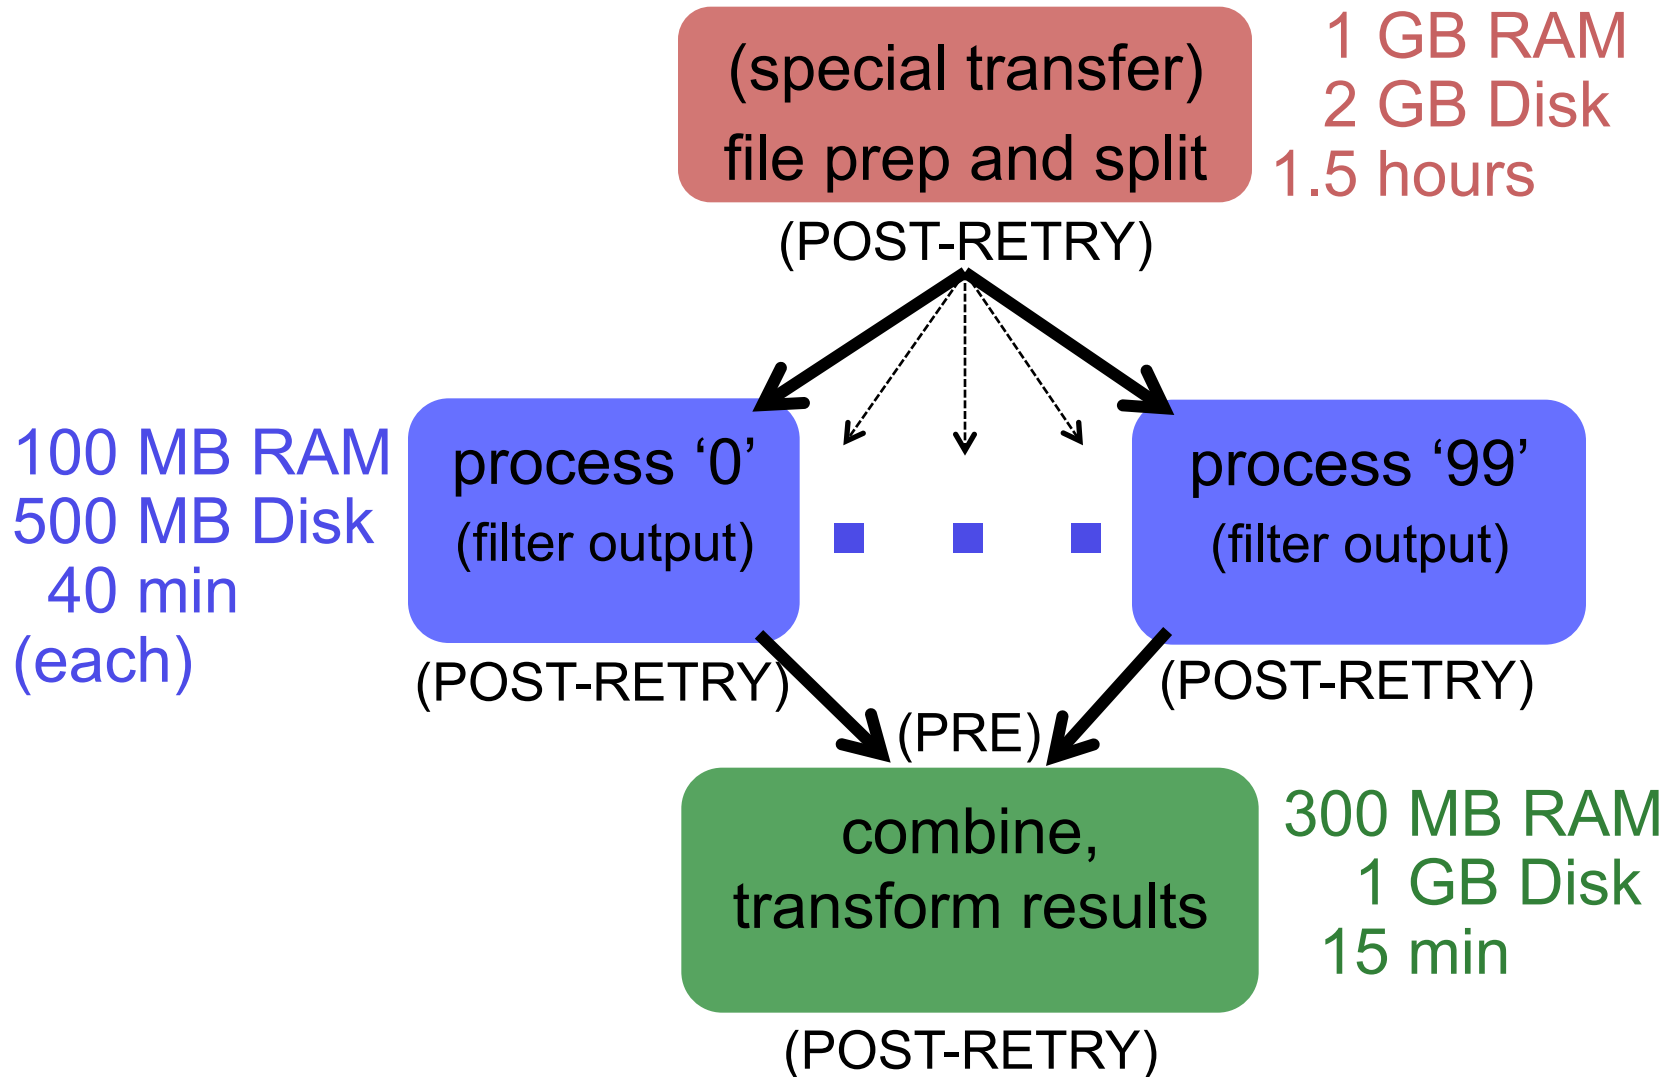

# Parallelize with HTC Splitting

# End Up with This

# Key HTC Principles

---

1. Increase Throughput
2. Be Kind to Your Submit Node
3. Bring it With You
4. 'Scriptify' As Much As Possible
5. "Testing, testing, 1, 2, 3 ..."

# Always focus on Throughput

---

## What is High Throughput

- many ‘smaller’ jobs
- persistent job pressure
- automation
- optimizing total workflow times

## What is not?

- job runtimes **less than 5 min**
- micro-optimizations

# 'Engineering' a Good Workflow

---

1. Draw out the *general* workflow
2. Define details (test 'pieces' with HTCondor jobs)
  - divide or consolidate 'pieces'
  - off-load file transfers and consider file transfer times
  - identify steps to be automated or checked
3. Build it piece-by-piece; test and optimize
4. Scale-up: data and computing resources
5. What more can you automate or error-check?

(And remember to document)

# Resources Jobs Need

---

- CPU
  - #CPUs and time
- RAM
- Disk
  - Working (execute side)
  - Total (submit side)
  - Compute bandwidth (file transfer)
- Network bandwidth
  - Usually for file transfer only

# First run jobs locally: To measure usage

---

- Did it run correctly?
  - Are you sure?
- Run once remotely
  - (on execute machine, not submit machine)!
- Once working, run a couple of times
- If big variance in resource needs, should you take the...
  - Average? Median? Worst case?

# User Log shows all

```
005 (2576205.000.000) 06/07 14:12:55 Job terminated.
    (1) Normal termination (return value 0)
        Usr 0 00:00:00, Sys 0 00:00:00 - Run Remote Usage
        Usr 0 00:00:00, Sys 0 00:00:00 - Run Local Usage
        Usr 0 00:00:00, Sys 0 00:00:00 - Total Remote Usage
        Usr 0 00:00:00, Sys 0 00:00:00 - Total Local Usage
5 - Run Bytes Sent By Job
104857640 - Run Bytes Received By Job
5 - Total Bytes Sent By Job
104857640 - Total Bytes Received By Job
Partitionable Resources :      Usage      Request
    Cpus                  :                  1
    Disk (KB)             :      122358      125000
    Memory (MB)           :          30          100
```

# Golden Rules for DAGs

- Beware of the shish kebab!
  - (self-checkpointing, next lecture)
- Use PRE and POST script generously
- RETRY is your friend
- DAGs of DAGs are good
  - SPLICE
  - SUB\_DAG\_EXTERNAL

# Wrapper Scripts are Essential

---

- Before execution (bring it with you!)
  - transfer/prepare files and directories
  - setup/configure environment and other dependencies
    - including run-time libraries (Matlab, R, Python, etc.)
- Execution
  - prepare complex command-line arguments
  - batch together many ‘small’ tasks
- After execution
  - filter, divide, consolidate, and/or compress files
  - check for errors

## Extra DAG tips

---

- PRE and POST scripts run on the submit node
    - avoid combining/splitting large files
    - avoid compiling
  - Remember: DAGs don't do loops well
- Solution: move more tasks into a 'job'

# Automate *A//* The Things

---

- well, not really, but kind of ...
- Really: What is the minimal number of manual steps necessary?  
even 1 might be too many; zero is perfect!
- Consider what you get out of automation
  - time savings (including less ‘babysitting’ time)
  - reliability and reproducibility

# Is It Worth the Time?

HOW LONG CAN YOU WORK ON MAKING A ROUTINE TASK MORE EFFICIENT BEFORE YOU'RE SPENDING MORE TIME THAN YOU SAVE?  
(ACROSS FIVE YEARS)

		HOW OFTEN YOU DO THE TASK					
		50/DAY	5/DAY	DAILY	WEEKLY	MONTHLY	YEARLY
HOW MUCH TIME YOU SHAVE OFF	1 SECOND	<div><div>1</div> DAY</div>	2 HOURS	30 MINUTES	4 MINUTES	1 MINUTE	5 SECONDS
	5 SECONDS	<div><div>5</div> DAYS</div>	12 HOURS	2 HOURS	21 MINUTES	5 MINUTES	25 SECONDS
	30 SECONDS	<div><div></div><div></div><div></div><div></div><div></div></div> <div>4 WEEKS</div>	<div><div>3</div> DAYS</div>	12 HOURS	2 HOURS	30 MINUTES	2 MINUTES
	1 MINUTE	<div><div></div><div></div><div></div><div></div><div></div><div></div><div></div><div></div></div> <div>8 WEEKS</div>	<div><div>6</div> DAYS</div>	<div><div>1</div> DAY</div>	4 HOURS	1 HOUR	5 MINUTES
	5 MINUTES	9 MONTHS	<div><div></div><div></div><div></div><div></div><div></div><div></div><div></div><div></div></div> <div>4 WEEKS</div>	<div><div>6</div> DAYS</div>	21 HOURS	5 HOURS	25 MINUTES
	30 MINUTES		6 MONTHS	<div><div></div><div></div><div></div><div></div><div></div><div></div><div></div><div></div></div> <div>5 WEEKS</div>	<div><div>5</div> DAYS</div>	<div><div>1</div> DAY</div>	2 HOURS
	1 HOUR		10 MONTHS	2 MONTHS	<div><div>10</div> DAYS</div>	<div><div>2</div> DAYS</div>	5 HOURS
	6 HOURS				2 MONTHS	<div><div></div><div></div><div></div><div></div><div></div><div></div><div></div><div></div></div> <div>2 WEEKS</div>	<div><div>1</div> DAY</div>
	<div><div>1</div> DAY</div>					<div><div></div><div></div><div></div><div></div><div></div><div></div><div></div><div></div></div> <div>8 WEEKS</div>	<div><div>5</div> DAYS</div>

# Batching (Merging) is easy

---

- Scripting
  - Avoids transfer of intermediate files
  - Debugging can be a bit tricky without scripted error reporting

# Breaking up is hard to do...

---

- Ideally into parallel (separate) jobs
  - reduced job requirements = more matches
  - not always possible
- Often need checkpoints
  - *standard* universe can help
  - user-defined check-pointing
  - checkpoint images can be hard to manage

# Automation: Parameter Sweeps

---

Command arguments can become complicated and messy.

- Wrapper scripts could:
  - Hardcode “extra” arguments
  - Compute arguments
  - Look up arguments from a table

# 'Engineering' a Good Workflow

---

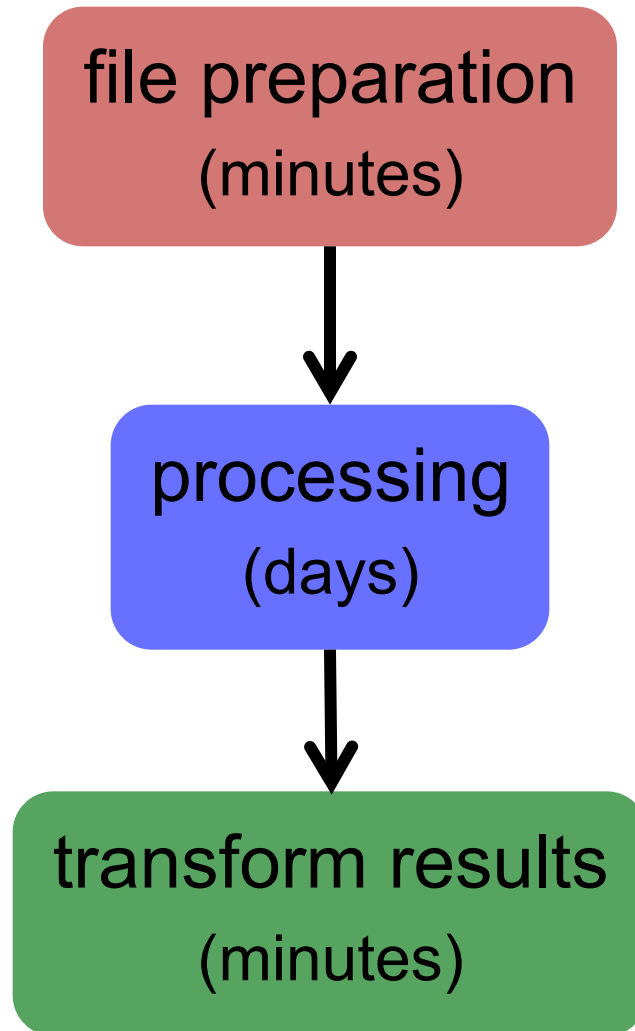

1. Draw out the *general* workflow
2. Define details (test 'pieces' with HTCondor jobs)
  - divide or consolidate 'pieces'
  - off-load file transfers and consider file transfer times
  - identify steps to be automated or checked
3. Build it piece-by-piece; test and optimize
4. Scale-up: data and computing resources
5. What more can you automate or error-check?

(And remember to document)

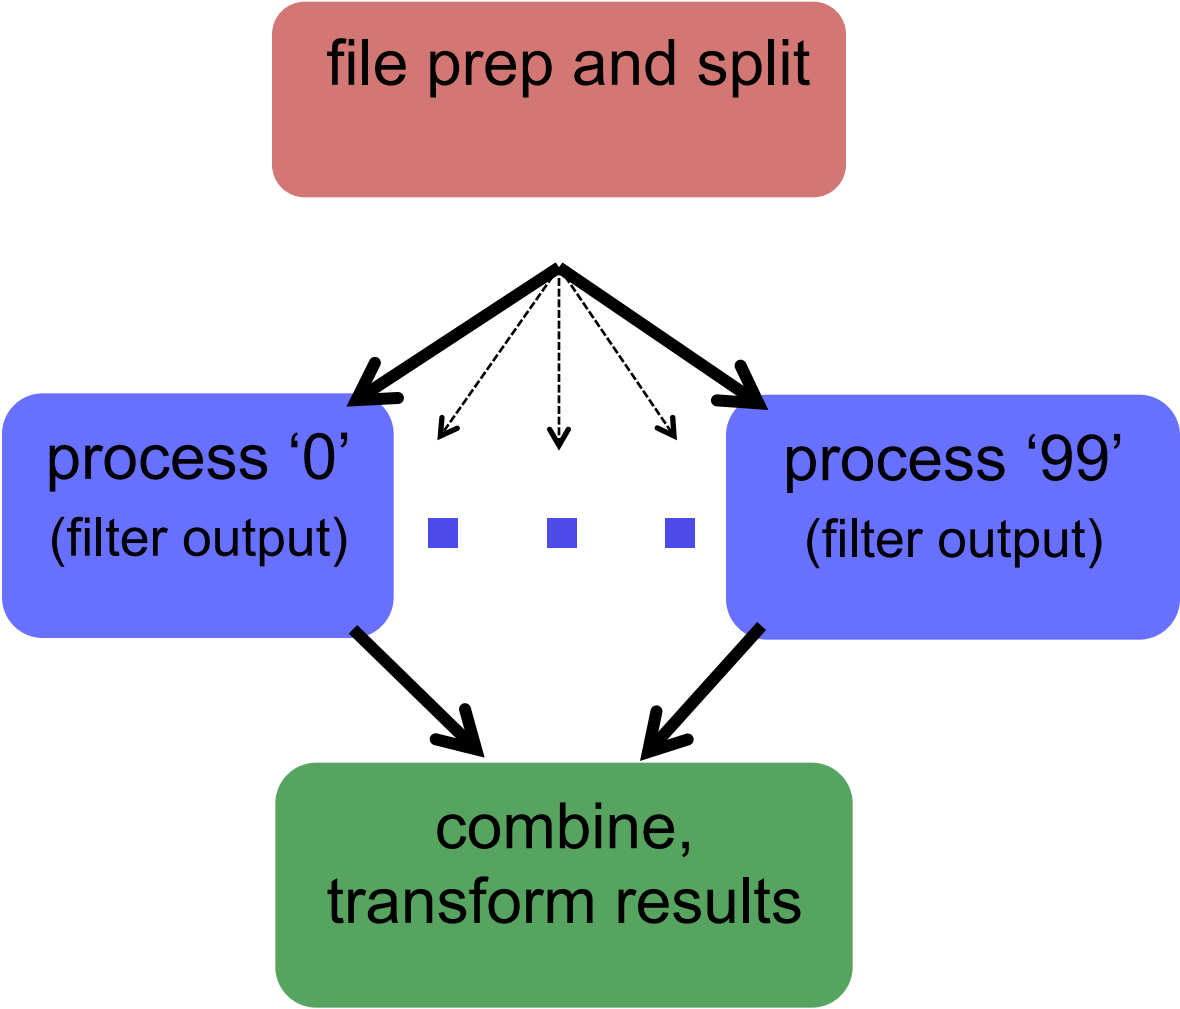

# Start with This

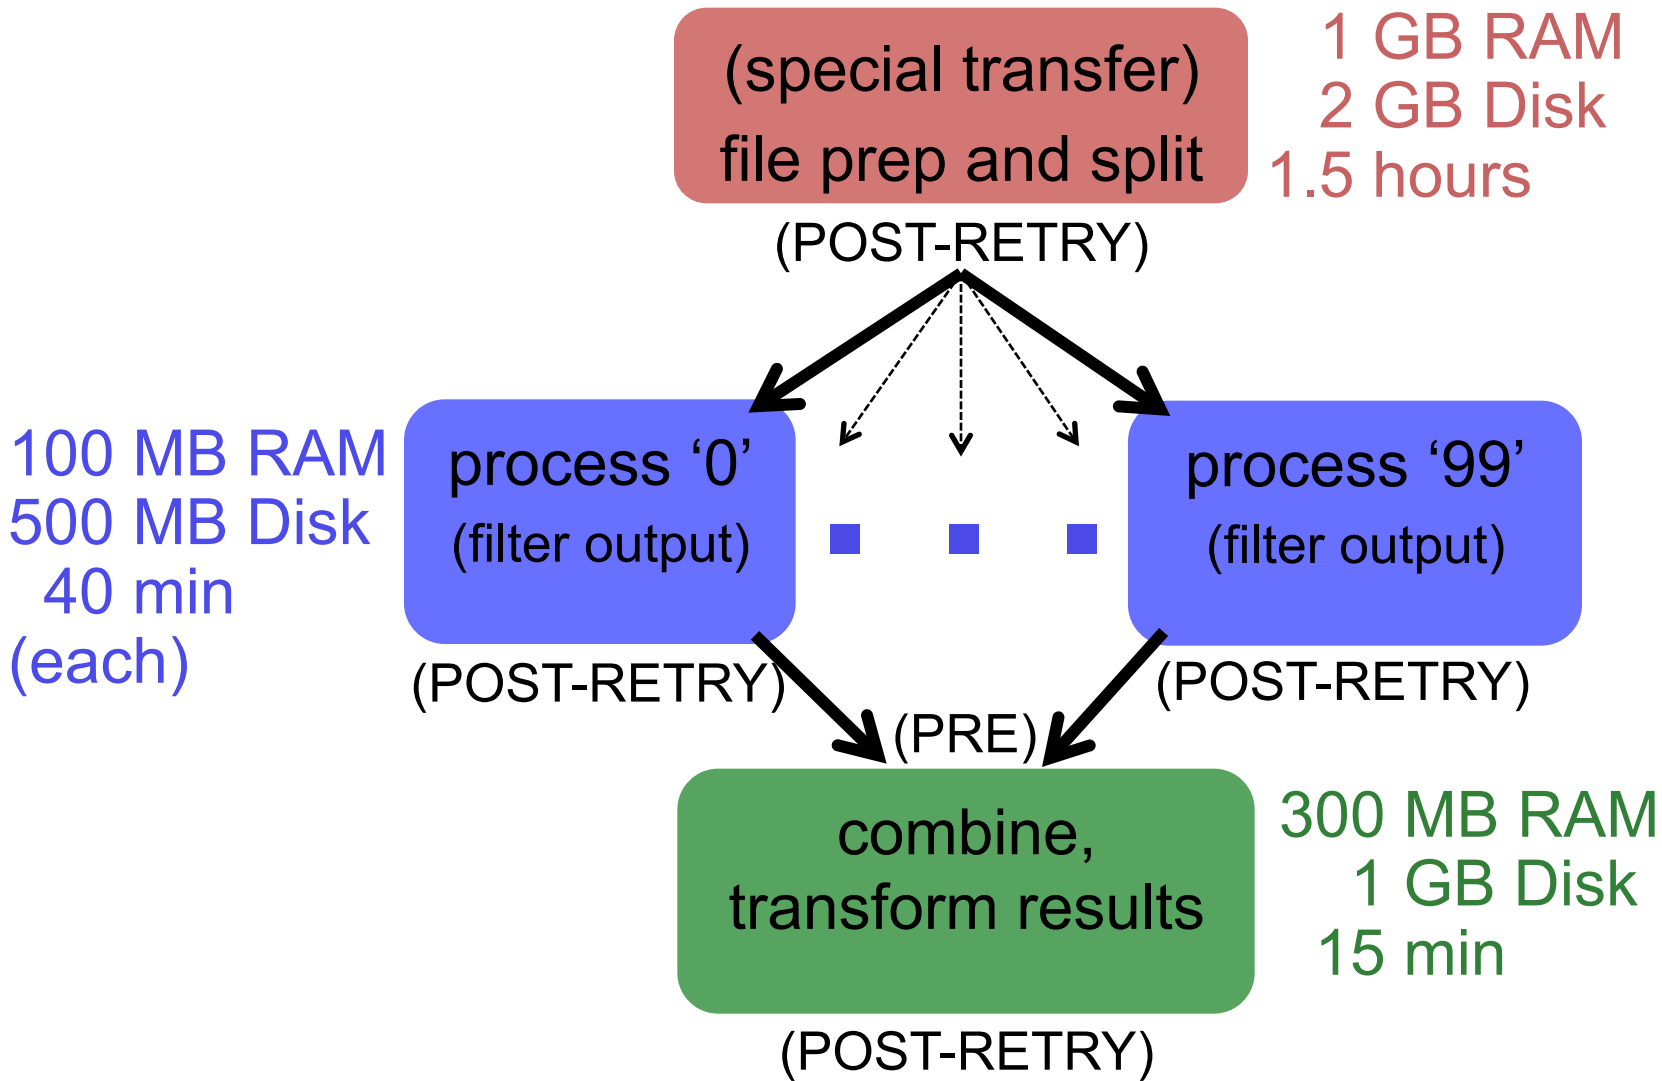

# Exercise 1

# Exercise 2

# Questions?

---

- Feel free to contact me:
  - [lmichael@wisc.edu](mailto:lmichael@wisc.edu)
- Now: “Joe’s Workflow” Exercise 6.1
  - 9:30-10am, in groups
- Later:
  - 10-10:30am: From Workflow to Production
  - 10:30-10:45am: Break
  - 10:45am-12:15: Exercises 6.2, 6.3
