

OSG Technology Area Update

Brian Bockelman
January 8, 2012

Key Initiatives

- Our current key initiatives:
 - HTCondor-CE
 - gWMS usability
 - Grid Exerciser
- Note: I removed OASIS from this list as I consider it mostly Operations now.

OASIS

- Almost fully transitioned to Operations. Minimal technology time.
- Technology will likely help with the second version - upgrading to CVMFS 2.1, improving remote submission.
- Still 1-2 weeks behind schedule - I think the initial release date is post-AHM right now.
 - GOC working on issues identified by OSG Security.
 - There are still some monitoring holes.
- NoVA testing is ongoing. FNAL security work ongoing.

HTCondor-CE

- One remaining piece missing from HTCondor team (audit logging).
 - Need this piece to do the security audit.
- Scale tests pass with HTCondor sites.
- Working on PBS next.
- Due to lack of short-term software effort, technology will be picking up several of the Software tasks in the workplan. Schedule slips accordingly.
- Documentation exists and the CE packaged in the *osg-development* repo. Probably could go into *osg-upcoming* once we have the missing HTCondor work.

gWMS Usability

- The first round of graphs have been created; working on first round of fixes. I expect a few more iterations.
- Starting conversations with the gWMS team about improving VO monitoring.
- Have been investigating the monitoring options for Condor in general.
- No clear unit of work yet.

Grid Exerciser

- Starting to “cut metal” on new GridEx.
- Expect to have an initial revision by time Ashu leaves.
- Will have more to report at the next Area Coordinator’s meeting.

Top Concerns

- **Effort:** Ashu Guru is leaving. We are trying to finish up projects and document knowledge as best possible.
- Expect GratiaWeb maintenance to be below nominal for a few months.
- My “management time” is increasing.
- **Cross-CE:** Progressing on glexec plugin issues, but it remains effort-starved.
- Some of this may be moot with the new traceability requirements. Been discussing with Mine.

Other

- Squid monitoring: it appears there is a fairly mature WLCG effort along these lines. Going to watch them and stay hands-off otherwise.
- Been helping/advising CMS run at SDSC using (partly) BOSCO.
 - Hoping to leverage this into getting SDSC more interested in OSG overall.
 - It's an interesting use case - can hook a glideinWMS factory to a site using only SSH!
- Per last Blueprint, starting to work to understand if OpenStack can be made to schedule.
