

Goal is to reach operations by January 28th, 2013.

Proposal: Request DOE Grids CA cease issuing new certificates start of business March 23rd, 2013 (CRLs would continue for another year).

Rational: LHC shutdown is March 11th, followed by the OSG AHM the following week and then a DOE PI meeting (Von Welch attending) the week after, making this the first non-conflicted date. Feedback is sought from the community on this date.

There are currently two blockers to the OSG PKI being production-ready:

1) Incompatibility between OSG PKI proxy certificates and ATLAS Panda servers at CERN. Status: GridSite developers have released an RPM with a fix, CERN deployed that fix earlier today and it is pending on testing by ATLAS.

2) Establishment of Fermilab Service Desk as RA for a number of VOs. Fermilab serves as a RA for a number of OSG VOs and has a parallel project in progress to establish this functionality for the OSG PKI. See attachment for specific VOs.

Other activities (not blockers to production):

1) While RAs for the large VOs have been established, progress continues for a number of smaller ones. Outside of the Fermilab VOs mentioned as a blocker, none of these pending VOs are considered

2) Discussion regarding whether we have the host-certificate/VO model right for optimal operations.

3) Improvements to client certificates based on initial user feedback.

4) Renewal capability: Has been deferred since it will not be needed for ~6 months but should be completed by operations. Needs support in OIM and client.

5) Documentation improvements based on user feedback.
